Last Page - Roadmap

01 - Requirements

Documents

Most important things to verify accounts is to have documents required by the KYC. Generally **Identity Card** or **Driver's License** with **selfie**. Depending of the country it can be more complicated to find goods providers. Don't worry, i know few **HQ providers**. Message me on telegram and i will give you my list.

Anti-detect browser

Use antidetec browser to avoid to be fingerprinted between multiples accounts than you create. With **Dolphin** you can have **10 profiles simultaneously** and it's **free**.

anty.dolphin.ru.com/en/

Camera Software

This method need camera software, internet browser and emulator.

I only advise to use **Splitcam** as camera software. Others tools are generally **detected** and causes **bugs**.

splitcamera.com

Emulator

I advise to use only Nox emulator. It's the **smoothest emulator**. You should be able to verify most of KYC with this emulator.

Bignox.com

I do not recommend to use Android Studio, you will be flagged cause your **IMEI** is "00000000000000".

I will explain in the future how to **modify your IMEI** for Android Studio, and make this software **viable** to use it with this method.

01 - Requirements

Proxy

You need **low fraud scores IP** to avoid to be **flagged**.

It's why i recommend to use **residential socks proxy** who allow you to select **country** and **ISP**.

There is many good alternatives :

socks.bz

922proxy.com

proxy-seller.com

Phone Number

If you want to rent phone numbers i can recommend 3 websites.

Hushed.com

Pingme.tel

Onoff.app

VPN

Choose a **VPN** who **doesn't keep your logs**. Mullvad VPN is the most used VPN by the community as he is cheap **5\$** per month and you can pay in **crypto** to increase your **anonymity**.

I don't recommend to use a VPN ip to create account, you can be flagged easily.

Crypto Wallet

Too many of you use exchangers like Binance or Coinbase on your real names to pay illegal related things.

Don't forget than all transactions can be retraced to you. It's why you have to used coldwallet like Exodus, Trustwallet or Ledger.

RDP

If you want to improve your anonymity you can use a **RDP**.

To run **Nox emulator** you need **RDP** with **GPU**.

I can recommend **GPU RDP** from AmazingRDP. Works very well on Nox **amazingrdp.com/graphic-card-rdp/**

If you don't plan to use emulators with this method you can use normal **RDP**. StarkRDP is one of the best provider from the community.

starkrdp.io

2 - OPSEC Guide

Before Starting

The goal is to anonymize you as much as possible, leaving the less traces as possible. That way nobody will be able to trace you, and in the case they suspect you they will not be able to find anything on your computer.

First step is to install a virtual machine. You can install Virtualbox who is the best software. [virtualbox.org](https://www.virtualbox.org)

Follow this video if you need help to create a virtual machine.

https://www.youtube.com/watch?v=sBzL_zoYt6o

Also don't forget to encrypt your virtual machine with a password after created it. Just go in the settings of your virtual machine, in "general" and you will see "Disk encryption" tab.

Second step is to setup your VPN on your main computer and on your virtual machine. As i said you can use Mullvad who is very appreciated by the community, and as i said before purchase a license in crypto to stay anonymous.

2 - OPSEC Guide

I always advise to connect to your RDP from your virtual machine.
Everytime you login to your RDP your IP and your computer name are logged.
To be able to connect to your RDP through your virtual machine you need to **Enable VBoxSVGA** and to **Insert Guest Additions CD image**

Just follow this video <https://www.youtube.com/watch?v=OECOMT0vbZ0>

You can now install an anti-detect browser, as i said Dolphin is the best and it's free
<https://anty.dolphin.ru.com/en>

Now everything is installed, your VPN is connected on your virtual machine and on your computer. And your anti detect browser is installed.
You have now a **good OPSEC** and ready to start **KYC Bypass**.

3 - Bypass KYC

- 01** You need to understand the different KYC procedure than a website can ask you.

Some **KYC** only ask you to **upload documents**, like Paypal.
Camera software and emulators are not needed.
You just have to use **Antidetect browser**.

There is also **KYC** who ask you a **live verification** through **webcam**, like Coinbase.
You only have to use **Camera Software** with an **Antidetect browser**.

There is now **KYC** who ask you to **complete** the **KYC verification** through a **phone**, like Cashapp.
You have to use **emulator** and **camera software**.

Some KYC will require an additional step cause they ask you to rotate your head. I explain how to resolve this step in mentorship.

3 - Bypass KYC

01 It's **very easy** to bypass the KYC when you have all required documents.

For KYC who have to be done via **webcam**, simply open your **Splitcam** and **import your documents images** and **selfie** in, **open** your **antidetect browser** and create a profile, disable **WebRTC** if you use **Dolphin**.

Go on **webcamtests.com** and **verify** if you **see** your **emulated camera** from **Splitcam**.

If you don't see it it mean an other camera applications take the priority so **uninstall** all others apps like OBS.

Also **unplug your webcam** if you have one, and if you use a laptop you have to disable it.

To disable it press "**Windows + R**" and type **devmgmt.msc**

Device manager should be open, search the name of your camera, it can be "**Integrated Camera**" and **disable it**.

3 - Bypass KYC

If you see your **camera correctly** you can now start the **verification**, a **border** will **appear**, simply **fit** your **documents image/selfie** into it. It's the **only thing** you have to do.

Example for Wise:

3 - Bypass KYC

01

For KYC who require a verification through phone you will have to use **Nox emulator** and **Splitcam**. It's the **same process** than for **webcam KYC** but on an **emulated phone**, verify if your **camera** is **correctly connected** on **Nox**, **go on Internet** in **Nox**, and verify on webcamtests.com and if your **camera** is the **same** than **Splitcam**, if it's **good** you can start the **verification** in your **applications**. If you want to **save time** simply **install APK** of your apps, type "**Applications Name + Apk**" and you will find easily an apk on google.

Same as before, simply **fit** your **documents image**/selfie **into** border and send your documents. Wait few minutes and your account should be verified.

If your KYC ask you for a head rotation verification message me and i will explain the correct way to do it. Method is harder to explain into a ebook so i will show you how to do it correctly during the mentorship.

4 - How to earn a lot of money with KYC Business

- 1- The **best way** to **make money** is to **resell accounts** than you verify yourself.

You can also **sell them** in **bundle**, generally customers looking for Bank + Crypto exchange to cashout their money. For example, **Coinbase + Wise** is a very good **bundle** to **make money**.

To make the most money possible i advise to verify and sell **Wise** and **Coinbase** accounts.
They can be **verified** in **5 minutes**, for a very low investment.
You can easilly sell a **Wise** account for **150\$** and a **Coinbase** account for 50-100\$.

If you want an advise, avoid to sell **Revolut** accounts, **price** is now to **low** so it's not worth as before considering the time it take to verify one.
CashApp was a good way to make money, but account can be **locked VERY easily**. It's why **price** is now so **high**.
- 2- If you want a tips to **increase** your **sales**, try to verify everyday **buyers** sections of the differents **blackhat** forums.
A lot of people here are looking to buy **verified accounts**.
- 3- Specify that you offer a **discount** for **resellers**, this will **maximize** your potential customers and it will increase your earn **considerably**.

5 - Keep your accounts longlasting

Most importants things to know to keep your accounts the longest time possible.

- 1- Always use a clean IP** when you're connected to your account. You can use a residential IP, or a proxy.
- 2- Avoid too big transactions** (more than 1000\$).
It's always better to do multiples smalls transactions than a big one.
- 3- Don't change accounts infos as soon you sold it.** Say to your customers to wait few days minimum before changing any infos, like email, phone number or password.
- 4- Don't load too much money on bank accounts.**
Your bank account is constantly **analyzed by AI**. Be careful to not load too much money or you will be **considered suspicious** and the **bank may ask you** for many **additional checks**.

6 - How to sell accounts correctly

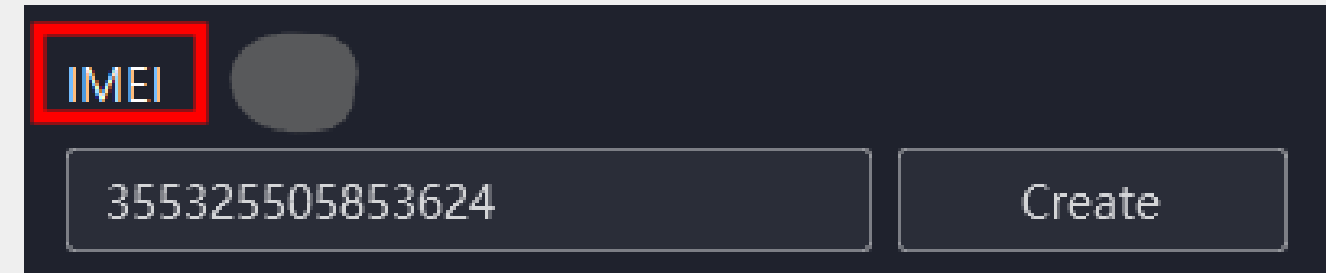

- 01** If you verified your accounts on Nox emulator you can export your Nox sessions and give the backup directly to your customers. You can do it by following these steps
<https://www.bignox.com/blog/how-to-backup-and-restore-your-data-in-nox-app-player/>
- 02** It's always better to share proxy to your customers to avoid account to be flagged.
- 03** You can open an autoshop but don't use Sellix as your shop will be closed in few days. Best alternative is **Sellpass** as you can accept Paypal Friends and Family, Cashapp and Crypto. **Atshop** is also a good alternative.
- 04** Always accept official middlemans like Liars or Lucas. Yes it's boring but if you don't accept it you will loose a lot of customers.
- 05** About warranty, i advise to only provide login warranty for accounts than you sell. Some users refuse to listen and use VPN to connect to accounts and it can lock instantly the account. You will also not be responsible of how they use accounts.

7 - Common errors and how to resolve them

01 Revolut - Error "Sorry but Revolut doesn't work on emulators"

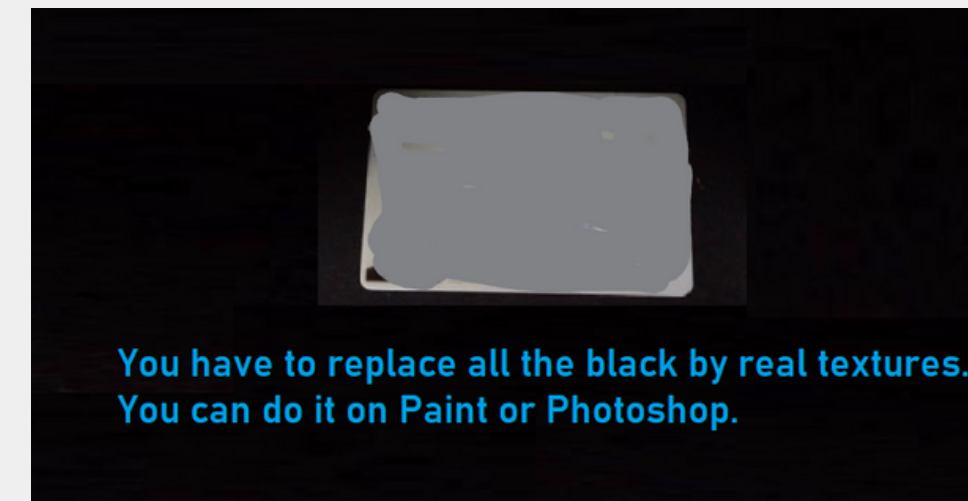

To resolve this just go on Nox settings and create an IMEI.
Restart Nox and it should be resolved.

02 Wise - Error "We can't accept printouts or photocopies" while uploading docs

This error happened when Wise detect the black part around your docs on Splitcam. To resolve this just add textures around your docs, so you can replace the black from Splitcam by real textures.

As you can see here i replaced all black border by wood texture.

03 "We can't accept this phone numbers cause it's a VOIP numbers."

Many websites like Paypal refuse VOIP Numbers but there is a way to pass this.
Go on pingme.tel, you will be able to see numbers before buying them.
Just test the differents numbers until one works and buy it if he is accepted by your website.

8 - How to load money on these accounts ?

01 The best way to load money on your account you just created is to use **P2P Crypto to Fiat exchange websites**.

You can use Paxful or Noones (KYC required).

You can also use Bisq, Agoradesk or Localcoinswap. (KYC not required).

A lot of seller allow you to exchange your Crypto to Revolut Balance, to Payoneer or directly to Wise or Paypal balance. You can also exchange your crypto to Bank Transfer easily.

Only deal with exchangers who have a lot of reviews, and avoid exchangers from Africa especially from Kenya, a lot of them are scammers.

Fee is generally 0-7%

Roadmap

Next updates of this ebook.

Create Business Accounts

Root and Emulator Bypass

SSL Unpinning

Advanced Deepfake

Faking camera of a real phone

Bypass Voice Required KYC

All of this will be give, for free during the futur updates of the ebook.
